# Component production copper processing module production

---

---

Since 2002 the uesa-component production at the site Uebigau has been a known entity in the production of components for the electrical industry. The product and service portfolio encompasses the production of various punching-, punching formed- and milling parts with and without surface conditioning as well as a module assembly. As further services we offer MAG- and WIG-welding, helium-leak tests, slide finishing, equipping of Cu-rails (setting-nuts) and the cover of Cu-rails (round/flat) with shrinkable tubing. A team of qualified staff and a modern machine park are a guarantee for the highest quality.

In our construction department we have the possibility, to create 3D-drawings of your products and complete our production documents (e.g. processing). For this we use the software Mechanical Desktop and Inventor.

The tools and devices necessary for production are made in uesa- toolmaking and by external tool-making companies.
